Effect of Vintage 2024 Population Controls on 2023 Income, Poverty, and Health Insurance in the United States Estimates

Liana E. Fox and Sharon Stern

U.S. Census Bureau[1]

September 9, 2025

SEHSD Working Paper Number FY 2025-13

The Current Population Survey Annual Social and Economic Supplement (CPS ASEC) is the official source for national estimates of income, poverty and health insurance coverage. To produce these estimates for the U.S. population, the 2025 CPS ASEC collected data from approximately 89,000 households across the 50 states and the District of Columbia.

To make inferences from this sample, CPS ASEC applies weights controlled to March 2025 independent national population estimates by age, sex, race, and Hispanic origin.

Starting with the data for 2020, the population estimates have been developed from a blended base population methodology, which incorporates 2020 Census population counts, the Vintage 2020 population estimates, and results from 2020 Demographic Analysis. These estimates are updated annually after accounting for births, deaths, and migration.

In addition to reflecting typical demographic change, the Vintage 2024 population estimates incorporated methodological improvements to the estimation of net international migration. This resulted in a fairly large increase in the total population, which

[1] This paper is released to inform interested parties of ongoing research and to encourage discussion of work in progress. Any opinions and conclusions expressed herein are those of the author and do not reflect the views of the U.S. Census Bureau. Any error or omissions are the sole responsibility of the author. All data are subject to error arising from a variety of sources, including sampling error, non-sampling error, modeling error, and any other sources of error. For further information on data collection, standards, accuracy, refer to <https://www2.census.gov/programs-surveys/cps/techdocs/cpsmar24.pdf> and <https://www2.census.gov/programs-surveys/cps/techdocs/cpsmar25.pdf> . All comparative statements in this paper have undergone statistical testing, and, unless otherwise noted, all comparisons are statistically significant at the 10 percent significance level. The Census Bureau has reviewed this data product to ensure appropriate access, use, and disclosure avoidance protection of the confidential source data used to produce this product (Data Management System (DMS) number: P-7534374, Disclosure Review Board (DRB) approval number: CBDRB-FY25-SEHSD003-101).

may impact comparisons between the 2024 CPS ASEC file, and the 2025 CPS ASEC file, which was weighted to the March 2025 value from the Vintage 2024 population estimates.

As a result of implementing the Vintage 2024 population estimates, comparisons of the estimated change in number of people between 2023 and 2024 (2024 CPS ASEC and 2025 CPS ASEC) reflect both demographic change and updates to the methodology. To support such comparisons, the Census Bureau produced a limited set of statistics for 2023 (2024 CPS ASEC) using the Vintage 2024 population estimates.

The following tables present key estimates and comparisons between the original published estimates using Vintage 2023 population controls and those created using Vintage 2024 population controls.

Table A-1.

Income Summary Measures by Selected Characteristics: 2023 Estimates Using Vintage 2023 and Vintage 2024 Population Controls

(Income in 2024 dollars, adjusted using the C-CPI-U. Households as of March of the following year. Information on confidentiality protection, sampling error, nonsampling error, and definitions is available at <https://www2.census.gov/programs-surveys/cps/techdocs/cpsmar24.pdf>)

Characteristic	2023						Percent change in real median income (Vintage 2024 less Vintage 2023)[*,2]

*An asterisk preceding an estimate indicates change is statistically different from zero at the 90 percent confidence level.

Z Rounds to zero.

[1] A margin of error (MOE) is a measure of an estimate's variability. The larger the MOE in relation to the size of the estimate, the less reliable the estimate. This number, when added to and subtracted from the estimate, forms the 90 percent confidence interval. MOEs shown in this table are based on standard errors calculated using replicate weights.

[2] Calculated estimate may be different due to rounded components.

[3] Federal surveys give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table shows data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Data for American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders, and those reporting Two or More Races are not shown separately.

[4] Information on metropolitan statistical areas and principal cities is available at <www.census.gov/programs-surveys/metro-micro/about/glossary.html>.

* An asterisk preceding an estimate indicates change is statistically different from zero at the 90 percent confidence level.

Z Rounds to zero.

Characteristic	2023									Difference in poverty estimates (Vintage 2024 less Vintage 2023)	
	Vintage 2023 controls					Vintage 2024 controls					
	Total	Below poverty				Total	Below poverty				
		Number	Margin of error[1] (±)	Percent	Margin of error[1] (±)		Number	Margin of error[1] (±)	Percent	Margin of error[1] (±)	Number	Percentage point

[1] A margin of error (MOE) is a measure of an estimate's variability. The larger the MOE in relation to the size of the estimate, the less reliable the estimate. This number, when added to and subtracted from the estimate, forms the 90 percent confidence interval. MOEs shown in this table are based on standard errors calculated using replicate weights.

[2] Federal surveys give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group, such as Asian, may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table shows estimates for the race-alone population and the Two or More Races population. The primary use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau presents data on race in a variety of ways. Estimates for Native Hawaiians and Other Pacific Islanders are not shown separately due to sample size.

[3] Information on metropolitan statistical areas and principal cities is available at <www.census.gov/programs-surveys/metro-micro/about/glossary.html>.

[4] The sum of those with and without a disability does not equal the total because disability status is not defined for individuals in the U.S. armed forces.

Note: Details may not sum to totals due to rounding. Estimates may differ from previous publications due to additional rounding implemented to protect respondent privacy. Details on Vintage 2023 and Vintage 2024 population estimate methdology can be found <https://www2.census.gov/programs-surveys/popest/technical-documentation/methodology/2020-2024/methods-statement-v2024.pdf>.

[1]A margin of error (MOE) is a measure of an estimate's variability. The larger the MOE in relation to the size of the estimate, the less reliable the estimate. This number, when added to and subtracted from the estimate, forms the 90 percent confidence interval. MOEs shown in this table are based on standard errors calculated using replicate weights.

[2]The estimates by type of coverage are not mutally exclusive; people can be covered by more than one type of health insurance during the year.

[3]Private health insurance includes coverage provided through an employer or union, coverage purchased directly, or TRICARE.

[4]Public health insurance coverage includes Medicaid, Medicare, CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), and care provided by the Department of Veterans Affairs (VA) and the military.

[5]Includes CHAMPVA, as well as care provided by the VA and the military.

[6]In the CPS ASEC, individuals are considered to be uninsured if they did not have health insurance coverage for the entire calendar year.

Note: Details on Vintage 2023 and Vintage 2024 population estimate methdology can be found <https://www2.census.gov/programs-surveys/popest/technical-documentation/methodology/2020-2024/methods-statement-v2024.pdf>.

*An asterisk preceding an estimate indicates change is statistically different from zero at the 90 percent confidence level.
Z Rounds to zero.

Characteristic	2023										Difference in Uninsured Estimates (Vintage 2024 less Vintage 2023)	
	Vintage 2023 Controls					Vintage 2024 Controls						
	Total	Uninsured[1]				Total	Uninsured[1]					
		Number	Margin of Error[2] (±)	Percent	Margin of Error[2] (±)		Number	Margin of Error[2] (±)	Percent	Margin of Error[2] (±)	Number	Percentage Point

[1] Individuals are considered to be uninsured if they did not have health insurance coverage for the entire calendar year.

[2] A margin of error (MOE) is a measure of an estimate's variability. The larger the MOE in relation to the size of the estimate, the less reliable the estimate. This number, when added to and subtracted from the estimate, forms the 90 percent confidence interval. MOEs shown in this table are based on standard errors calculated using replicate weights.

[3] Federal surveys give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group, such as Asian, may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table presents data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Data for American Indians and Alaska Natives, Native Hawaiians or Pacific Islanders, and those reporting two or more races are not shown separately.

[4]Children under the age of 19 are eligible for Medicaid/CHIP.

[5]This age group is of special interest because of the Affordable Care Act's dependent coverage provision. Individuals aged 19 to 25 years may be eligible to be a dependent on a parent's health insurance plan.

[6]The sum of those with and without a disability does not equal the total because disability status is not defined for individuals in the U.S. armed forces.

Note: Details on Vintage 2023 and Vintage 2024 population estimate methdology can be found <https://www2.census.gov/programs-surveys/popest/technical-documentation/methodology/2020-2024/methods-statement-v2024.pdf>.
